

Find it, Fix it, Faster!

**Vulnerability Management
& Orchestration Platform**

Find it, Fix it, Faster!

Key Benefits

No more spreadsheets, get real reports

See everything in a single pane. Resolve's data aggregation capabilities provide a single system of record to track, prioritize, and report on vulnerabilities.

Fix faster with less effort

Correlation allows you to combine instances of the same vulnerability into a single ticket, while standardized definitions, severity ratings, and remediation instructions allow teams to complete fixes faster.

Streamline pentesting data

Organizations that depend on third-party pentesters can easily incorporate the results into remediation workflow for tracking. In-house pentesters have additional tools to ensure consistency, track results, and consolidate data.

Get your priorities in order

Prioritize with your own severity ratings. Use your own asset data to provide context on the most important fixes.

Orchestrate your security efforts

Assign responsibilities, track SLAs, and verify compliance across your entire organization. Ensure all your departments are working together successfully.

Most vulnerability management programs are being stretched beyond their safe limit. See if you fit the profile.

You have a growing backlog of vulnerabilities.

Scanners produce large streams of noisy, overlapping vulnerability data. Pentest results are submitted in static documents. Tracking ends up in spreadsheets, a messy and time-consuming method fraught with potential for mistakes.

You're not sure if vulnerabilities are fixed.

Remediation is managed via spreadsheets, PDFs, and emails. Identifying ownership across the organization takes time, and there aren't enough resources to fix every problem. Exceptions are hard to track and follow up on without significant manual effort. Verifying a fix is in place is rare.

You don't know where you might be exposed.

Remediation times are measured in months – not days or weeks – leaving security gaps that could result in data breaches.

Resolve Automates, Tracks, and Orchestrates Vulnerability Management Processes at Every Stage

Resolve is the first commercially-available vulnerability management and orchestration platform. Resolve correlates all your vulnerability data from across your organization into a single view, so you can discover, identify, and fix vulnerabilities faster, and reduce your risk exposure.

Ingest

Many organizations receive security data from automated scanners, along with manual pentesting results, identifying thousands or millions of vulnerabilities. Resolve aggregates all of them, even vulnerabilities without CVEs, to serve as your single clearinghouse for vulnerability data.

Correlate

Data siloes and lack of integration often lead to duplicated efforts and wasted time. Resolve normalizes, de-duplicates, and compresses vulnerability data to distill truly unique vulnerabilities. Reduce the amount of noise from multiple instances of the same issue, and generate a single ticket so you can remediate more quickly.

Enrich

Different scanners and testers often use varying definitions and remediation instructions. Resolve lets you standardize vulnerability definitions, severity, and remediation instructions across your organization. Use Resolve's built-in vulnerability knowledge library, developed by our internal subject matter experts, or load your own organization-specific information once, and apply it across all applicable vulnerabilities.

Assign

Vulnerability data can pass from ingestion to remediation with automatic assignment to application and asset owners. A trackable retesting process and remediation exception workflow allow modification of assignments and queues, so specific vulnerabilities can be escalated as needed. With a single location for the storage of all vulnerabilities, Resolve can also serve as a communication hub for team collaboration throughout the vulnerability management lifecycle.

Report

Security and business leadership need clear and complete reports to prioritize resources and direct security efforts. Automated report generation provides immediate, actionable insight into your organization's security posture, and eliminates hours of manual labor, so your security teams have more time for problem solving and remediation.

Simplify Vulnerability Management Across your Organization

RE
SOLVE
RES

Vulnerability Managers

- Normalize and distill unique vulnerabilities across all sources
- Assign remediation across departments and teams
- Track testing and retesting processes
- Communicate and collaborate in a centralized hub
- Verify SSDLC compliance
- Manage exceptions with remediation exception request workflow
- Gain situational awareness through single-pane visibility and reporting

Security Testers

- Centralize scoping data for collaboration
- Aggregate and normalize scanner data files
- Save time with bulk vulnerability markup and verification
- Ensure repeatability with centralized test procedures and tester checklists
- Leverage the remediation recommendation knowledgebase
- Generate .xls or .xlsx, .doc, and .pdf reports automatically

Compliance and Audit

- Combine all vulnerabilities in a single location
- Reinforce consistent testing procedures
- Integrate data with governance, risk management and compliance (GRC) tools
- Track exceptions and remediation compliance

CISO

- Single pane of glass for your Organization's Vulnerability stack and remediation progress
- Observe exploit and remediation trends over time
- Access all vulnerability information from a single location in real time

Asset Owner

- Send scope questionnaires and collaborate with the security team
- Automate test requirement workflow
- Get notifications and transparency into testing

NetSPI Resolve Product Features

Data agnostic source integration

Aggregate and correlate data from more than 20 infrastructure and application scanners and manual findings. Include results from third-party testing vendors.

Bi-directional communication capabilities

Correlated and normalized data can be fed into ticketing systems and governance, risk and compliance (GRC) solutions for remediation assignment, tracking, and compliance.

Workspaces and checklists for testers

Allow multiple testers to work simultaneously on the same project and combine findings in a single workspace for reporting. Use checklists to track progress for any test type and ensure consistency.

Vulnerability enrichment

Normalize confidence and severity across scanners with a rich library of remediation instructions built in, or record your organization-specific policies once and apply them across all applicable vulnerabilities.

Automated report generation

Generate reports in Word, Excel, PDF, and .csv file formats for easy distribution. Customize reports and templates for specific types of tests and data needs, and for internal corporate branding. Store summaries and findings in Resolve and re-use them in reports automatically.

High-level dashboards

Track trends over time for a better understanding of remediation completion time and rates, total vulnerabilities, and severity of vulnerabilities.

Service-oriented architecture

Deploy Resolve flexibly across a wide range of environments, adapt and maintain the solution easily, and scale readily to your growing business.

About NetSPI

NetSPI LLC is the leading provider of application and network security testing solutions that supports organizations in scaling and operationalizing their threat and vulnerability management programs. The solution portfolio includes security testing services, vulnerability orchestration software platform, and advisory services. Trusted by six of the top ten United States banks, the largest global cloud providers, and many of the Fortune® 500, NetSPI has deep expertise in financial institutions, healthcare providers, retailers, and technology companies. To learn why the world's top brands trust NetSPI, visit www.netspi.com or follow us on [Facebook](#), [Twitter](#) and [LinkedIn](#).
